

C Programming - Short Notes

Variables

- Used to store data values.
- Each variable has a data type.
- Example: `int a = 10;`

Loops

- Used to repeat a block of code.
- Types: `for`, `while`, `do-while`.
- Helps reduce repeated code.

Functions

- Functions perform specific tasks.
- Improve modularity and reusability.
- Example: `printf()`, `scanf()`.

Arrays

- Store multiple values of same type.
- Accessed using index values.
- Example: `int arr[5];`
