

C Programming - Summary

C is a powerful and structured programming language developed by Dennis Ritchie. It is widely used for system programming, application development, and embedded systems. C programs are built using functions, variables, operators, loops, and arrays. The language is fast, efficient, and forms the base for many modern programming languages.

Important Concepts

- Variables are used to store data.
- Data types include int, float, char, and double.
- Loops like for, while, and do-while repeat statements.
- Conditional statements include if, else, and switch.
- Functions improve code reusability.
- Arrays store multiple values of the same type.
- Pointers store memory addresses.
